

# PHASE- IV

## *STOCK PRICE PREDICTION*

### *DATA PREPROCESSING*

#### ➤ **LOADING A DATASETS**

The screenshot shows a Jupyter Notebook window titled 'Untitled89' running on a local host. The code in the first cell imports pandas and numpy, reads a CSV file, and prints the first few rows of the resulting DataFrame. The output shows a table with columns: Table Code, State Code, District Code, and Area Name. The second cell shows the result of the 'a.info()' command, displaying the data types and memory usage of the DataFrame.

```
In [2]: import pandas as pd
import numpy as np
a=pd.read_csv("C:\\Users\\OOAD LAB\\Downloads\\DDW_B06ST_3300_State_TAMIL_NADU-2011.csv")
print(a)
```

	Table Code	State Code	District Code	Area Name
0	B0906ST	33	000	State - TAMIL NADU
1	B0906ST	33	000	State - TAMIL NADU
2	B0906ST	33	000	State - TAMIL NADU
3	B0906ST	33	000	State - TAMIL NADU
4	B0906ST	33	000	State - TAMIL NADU
...	...	...	...	...
589	B0906ST	33	633	District - Tiruppur
590	B0906ST	33	633	District - Tiruppur
591	B0906ST	33	633	District - Tiruppur
592	B0906ST	33	633	District - Tiruppur
593	B0906ST	33	633	District - Tiruppur

```
In [3]: a.info()
```

## FEATURE ENGINEERING

Feature engineering refers to the process of using domain knowledge to select and transform the most relevant variables from raw data when creating a predictive model using machine learning or statistical modeling.

## What is Feature Engineering?

```
# Number of contractions (can't, won't, don't, haven't, etc.) in text
import re

def contraction_count(sent):
    count = 0
    count += re.subn(r"won't", '', sent)[1]
    count += re.subn(r"can't", '', sent)[1]
    count += re.subn(r"n't", '', sent)[1]
    count += re.subn(r"'re", '', sent)[1]
    count += re.subn(r"'s", '', sent)[1]
    count += re.subn(r"'d", '', sent)[1]
    count += re.subn(r"'ll", '', sent)[1]
    count += re.subn(r"'t", '', sent)[1]
    count += re.subn(r"'ve", '', sent)[1]
    count += re.subn(r"'m", '', sent)[1]
    return count

df["excerpt_num_contractions"] = df["excerpt"].apply(contraction_count)
df[["excerpt", "excerpt_num_contractions"]].head()

## WHAT IS MODEL TRAINING?

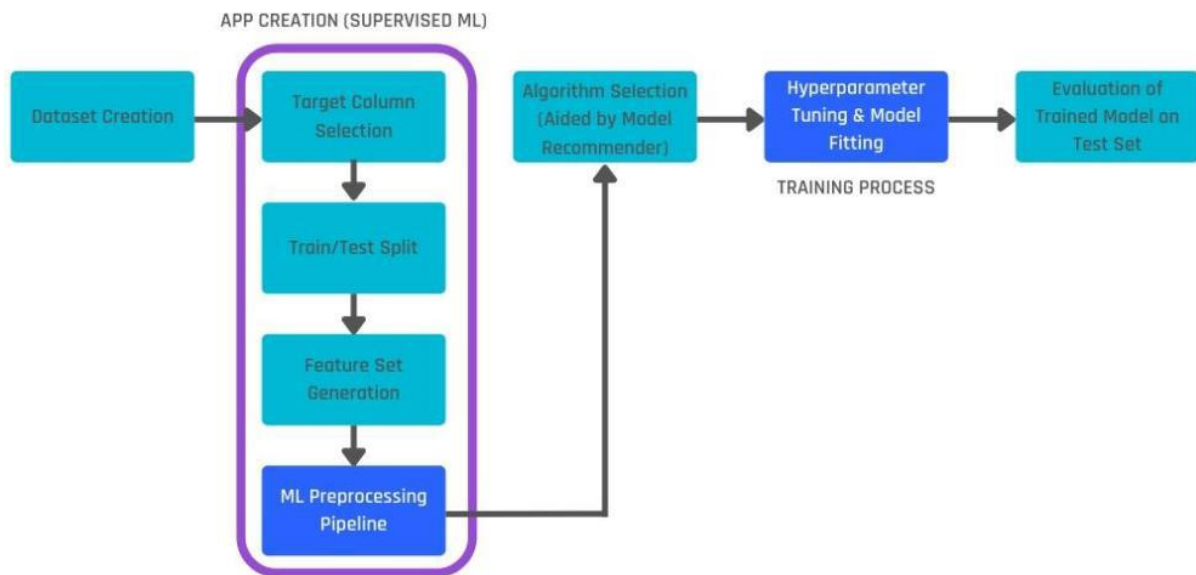

Model training is the phase in the data science development lifecycle where practitioners try to fit the best combination of weights and bias to a machine learning algorithm to minimize a loss function over the prediction range.

## STEPS TO TRAINING MACHINE LEARNING MODEL

- Step 1: Begin with existing data. Machine learning requires us to have existing data—not the data our application will use when we run it, but data to learn from. ...

- Step 2: Analyze data to identify patterns. ...

- Step 3: Make predictions

In [10]: *# prepare data frame for splitting data into train and test datasets*

```

features = []
features = df_churn_pd.drop(['CHURNRISK'], axis=1)

label_churn = pd.DataFrame(df_churn_pd, columns = ['CHURNRISK'])
label_encoder = LabelEncoder()
label = df_churn_pd['CHURNRISK']

label = label_encoder.fit_transform(label)
print("Encoded value of Churnrisk after applying label encoder : " + str(label))
  
```

Encoded value of Churnrisk after applying label encoder : [2 1 1 ... 2 1 1]

## MODEL EVALUATION

**Model evaluation is a crucial aspect of machine learning, allowing us to assess how well our models perform on unseen data. In this step-by-step**

guide, we will explore the process of model evaluation using Python. By following these steps and leveraging Python's powerful libraries, you'll gain valuable insights into your model's performance and be able to make informed decisions. Let's dive in and evaluate our machine learning models!

### Step 1: Prepare the Data

The first step in model evaluation is to prepare your data. Split your dataset into training and test sets using the `train_test_split` function from the `scikit-learn` library. This ensures that we have separate data for training and evaluating our model.

```
from sklearn.model_selection import train_test_split
# Split the data into training and test sets
X_train, X_test, y_train, y_test = train_test_split(X, y, test_size=0.3, random_state=42)
```

### Step 2: Train the Model

Next, select an appropriate model for your task and train it using the training set. For example, let's train a logistic regression model using `scikit-learn`:

```
from sklearn.linear_model import LogisticRegression
# Create an instance of the model
model = LogisticRegression()
# Train the model
model.fit(X_train, y_train)
```

### Step 3: Evaluate on the Test Set

Now, it's time to evaluate our model on the test set. Use the trained model to make predictions on the test data and compare them to the actual labels. Calculate evaluation metrics such as `accuracy_score` to measure the model's performance.

```
from sklearn.metrics import accuracy_score
# Make predictions on the test set
y_pred = model.predict(X_test)
# Calculate accuracy
```

```
accuracy = accuracy_score(y_test, y_pred)
print("Accuracy:", accuracy)
```

#### Step 4: Perform Cross-Validation (Optional)

To obtain a more robust evaluation, you can perform cross-validation. This technique involves splitting the data into multiple folds and training/evaluating the model on different combinations. Here's an example using `cross_val_score` from scikit-learn:

```
from sklearn.model_selection import cross_val_score
# Perform cross-validation
scores = cross_val_score(model, X, y, cv=5)
# Calculate the average performance across all folds
mean_accuracy = scores.mean()
print("Mean Accuracy:", mean_accuracy)
```

#### Step 5: Assess Model's Performance

Analyze the evaluation metrics obtained from the previous steps to assess the model's performance. Consider the context of your problem and compare the results against your desired performance level or any baseline models. This analysis will provide insights into the strengths and weaknesses of your model.

#### Step 6: Iterate and Improve (if needed)

Based on the assessment, you may need to iterate and improve your model. Consider collecting more data, refining features, trying different algorithms, or tuning hyperparameters. Repeat the evaluation process until you achieve the desired performance.
